## **Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

- 1. (Currently Amended) A sea surface antenna comprising a tube of metallic material, the tube having a substantially longitudinal slot coupled at its midpoint to a feed line, the slot being bridged by two pluralities of varactor diodes to either side of the feedpoint, each plurality being distributed along a respective part of the slot, the length of the antenna being dimensionedless than  $0.25\lambda$ , where  $\lambda$  is the free space wavelength at the operating frequency, the antenna being dimensioned so as to operate in an evanescent mode at a resonant frequency less than the cut-off frequency, the antenna being provided with means for applying a variable bias to the varactor diodes.
- 2. (Original) An antenna according to claim 1 wherein the slot is shorted at each end.
- 3. (Previously Presented) A sea surface antenna comprising a tube of metallic material on a dielectric former, the tube having a longitudinal slot coupled at its midpoint to a feed line, the slot being bridged by two pluralities of varactor diodes to either side of the feed-point, each plurality being distributed along a respective part of the slot, the length of the antenna being less than  $0.25\lambda$  and the diameter of the antenna being less than  $0.02\lambda$ , where  $\lambda$  is the free space wavelength at the operating frequency, the antenna being dimensioned so as to operate in an evanescent mode at a resonant frequency less than the cut-off frequency, the antenna being provided with means for applying a variable bias to the varactor diodes.

- 4. (Currently Amended) An antenna according to claim 23 wherein the slot is shorted at each end.
  - 5. (Canceled)
- 6. (Currently Amended) A sea surface antenna arrangement including two or more like antennas according claim to 3-placed in a colinear configuration and connected electrically in parallel, wherein each of said like antennas comprises a tube of metallic material on a dielectric former, the tube having a substantially longitudinal slot coupled at its midpoint to a feed line, the slot being bridged by two pluralities of varactor diodes to either side of the feed-point, each plurality being distributed along a respective part of the slot, the length of the antenna being less than  $0.25\lambda$  and the diameter of the antenna being less than  $0.02\lambda$ , where  $\lambda$  is the free space wavelength at the operating frequency, the antenna being dimensioned so as to operate in an evanescent mode at a resonant frequency less than the cut-off frequency, the antenna being provided with means for applying a variable bias to the varactor diodes.
